Home / Stick Guides 36.5 161cm(5'4) - 178cm(5'10) 37.5 179cm(5'11) - 188cm(6'2) 38.5 189cm(6'3) & Up Are you a field hockey beginner or just want to buy a new stick? There are numerous options available that finding the ideal stick for you can be an overwhelming task. In addition, there are various factors to consider when buying a new stick: weight, length, skill level and the curve or bow of a stick. All of these are qualities that impact your overall gaming performance. A well-selected field stick will complement your skill and candidly raise the game. Where do you start finding the best stick? The Length of the Hockey Stick It is essential to have a stick of the right size to realize both basic and advanced skills. Longitudinal measurement can be the decisive problem in completing a passage, facing or even making mistakes. A midfielder or defensive player might have a preference for a longer stick so as to further guide the ball while an offensive player can choose a shorter one for better control and handling of the ball. Sticks can range from 28 inches to 37.5 inches or more. Of course, the stick should reach the top of the hip bone. Which materials are ideal for you? The sticks are made from a range of different materials such as Kevlar, aluminum, fiberglass and even titanium. You need to know your level of play and what use the stick will need. For serious players who know how to play better and will play regularly with their stick, a kevlar composite stick or graphite could be the perfect alternative. These tend to be tailor-made with experienced players in mind. A wide assortment/wide choice of sticks: there is a wide range of hockey sticks and you should try the many different sticks until you discover one perfect for you. There is no wrong or correct answer; it's entirely up to you to make the stick that's more satisfying and effective for your game. Goalie stick The goalkeeper is one of the most important jobs on the pitch and we want to help you be your best. As long as the stick feels comfortable when you hold it, then it should be fine. Compared to field sticks, they are usually straighter (to better control deviations), lighter (because transporters do not hit the ball so much and balanced in a different way (because the conveyors also hold the stick in a different way). A very long stick can be a problem if the handle continues to be caught on your body while playing. Goalkeeper sticks are also available in different types. Defensive hockey stick As a general rule, defenders need a strong stick to deal with. They too must be powerful to help in the clearance of the ball. To achieve both features, they usually select a longer stick to help reach tackles and heavy to give a better strike power, compared to players in other hockey positions. Hockey stick midfielder players require fast ball handling skills and the ability to make big tackles. They do not need their sticks to be too heavy, but they require a long service life. The design of the middle finger is well impartial and will provide the requirements of a midfielder. Sticks that have a strong fiber will help in controlling the ball during dribbling and entrapment. Attack with attacking hockey stick Attackers are constantly on the attack and, as a result, need speed accuracy and ball handling skills. Their sticks should have a lighter weight than those for defenders as they will aile with movement. Power is also and sticks with a high carbon content will help in this without adding unnecessary weight. Field stick material Your stick is an essential piece of equipment during the field hockey game. Depending on what a player is looking for in a stick, various materials make the difference in the ability and feel of the stick during the game. In the past, sticks were usually made of hard woods. Today, manufacturers use composite materials such as fiberglass, graphite, carbon and Kevlar. Kevlar is a material that can also be combined with different materials such as carbon to create a stick used alone. Kevlar sticks are relatively expensive sticks, but one of the strongest and lightest available. Hockey sticks are made only for right-handed hockey players unlike other sports with clubs, bats or sticks, field hockey needs players to use left-handed sticks - even for those who are left-handed naturally. Each stick has a rounded side and a flat side. You can only use the flat side of hockey sticks, both for port goalies and players on the field. Hitting the ball with the back stick or rounded side is a violation of the rules. The length of the stick length varies in line with the player's height, and the weight may fluctuate somewhere from 18 to 25.9 ounces. The handle of the sticks is made of various materials, such as rubber and suede, to reduce the amount of moisture on the stick. In addition, the best players go for sticks with a high carbon content as it adds power and stiffness. The higher percentage of carbon is the result of excellent energy production. Also, medium balanced hockey sticks or higher weight Conventionally the pole manufacturers had classified their merchandise with weight guides such as Heavy (H), Medium (M) and Light (L) each indicating an interval of 30 - 40g. However, it has recently been specified by the FIH (International Hockey Federation) that the maximum weight for a hockey stick must be 737 grams, although the overall taste is considerably lower than this weight. Sticks are curled for left-handed or right-handed players with so many non-straight blades nowadays. The blades are curved at the heel, toe or center, and athletes feel they can lift the puck higher and higher. However, reverse shots and passes are a bit harder to reach. Currently due to the requirements of the current game very few manufacturers produce heavy sticks, this is because when a hockey stick is excessively heavy, a player eventually turns more gradually or slowly. Manufacturers today produce Extra Light sticks that are in high specs due to the costs involved in the production of a stick that maintains its power and rigidity are not a key concern. Attackers like to have a greater impact on the ball that comes with a heavier stick: will hit the ball harder, and provided that you are physically powerful enough to be in command of the head, head, can make your shots against the goalkeeper more powerful. A defender would certainly benefit from the elasticity of a lighter stick with a muscular shaft that will allow them to respond more quickly to the need to present a tackle. A midfielder would opt for a balanced stick to gain the advantage of both. Beginners start mainly with elastic sticks to facilitate shock absorption. Experienced players typically prefer rigid sticks or composite sticks for amplified power. Those who want to continue with the game should buy stiffer sticks; produce more power with each shot, they are also lighter and more durable. Grips and this stick blade covered with an elastomeric polymer, for example polychlorinatedprene to offer a coating reveals perfection in sensation, adhesion, water absorption, resilience and wear. It is not unusual to find players covering the blade of their sticks with a coating material. There are various reasons why hockey players cover the blades of their sticks. One explanation is to have a better feeling of their stick grip. Another is to reduce the damage and wear of the blade. Sticks can be a soft plane (Non-Grip) or a sticky structured surface (Grip) and have no different grip sizes. The plane of an anti-grip stick is very smooth, allowing the lower hand to move quickly up and down the shaft for greater passage, handling and stick shooting. A grip stick can be the best choice for a player. Some grips cover the entire stick, while others are only located in the main region of the tree where a player's hands are located. Curfs are built mainly on these three options: face angle, curve type and curve depth. The lie of the blade is also an important quality. As a rule, defenders need good ball control when making exit passes and the aptitude to shoot low and hard, so it is generally better to go with a medium curl or moderate or light heel that has a slightly open or closed face angle. For example, 75 degrees and an angle of 45 degrees could make a huge difference. Attackers are inclined to do a lot of ball handling and take more snapshots and wrist shots, so a center curve or point fingers somewhere from minor to deep, depending on a player, with an open or closed face angle would be suitable. Hockey stick length The length of the stick is mostly associated with your height. However, a player can have various inclinations depending on the position on the field, the level of comfort, the style of play. If you're a midfielder or striker, you may need a shorter stick than a defender would prefer shorter sticks allow for better movement. Conventionally senior hockey players used sticks 1 meter or 36 inches long, but over the past decade, the standard length has been increased to 36.5 inches. At present, there is no fixed limit governing the limit length of a stick; however, manufacturers avoid making many sticks that are longer than 38.5 inches or about 91 cm. But some manufacturers could make custom sticks for lengths of up to about 42 inches. In many ways, in many ways, the overruling factor that should control the length of the selected stick is your height, although that's not the only consideration. In most young players choosing a stick of appropriate length is vital in the development of control and ball skills. Determining the correct length of the stick is relatively easy if it is not above the level, so you are on the right path. There are three types of sticks: - Children's sticks range from 21 to 26 inches (53 - 66 cm). - Youth sticks range from 27 inches to 35 inches (69 - 89 cm). - Adult sticks range from 36 to 38 inches (91 - 97 cm). The Committee on The
